BCS Wireless Zoom Camera

Camera System for Mobile Telescopic Cranes

- For mobile telescopic cranes BCS developed a unique camera equipped with an electrical auto-tilt module. This module makes sure that the camera is always pointed vertical and focussed at the hook or grab independently of the angle of the boom.
- The tilting angle is manually adjustable from within the cab to optimize the view.
- All the functions of the system can be operated by using the multifunctional remote control. Equipped with a wireless transmitter/receiver.

Advantages:

- The camera is insensitive for wind
- The camera can be mounted at less damage sensitive places
- The camera can change the viewing angle and therefore guarantees an optimal view
- The system contains the following components:
Zoom camera, transmitter/receiver, remote control with joystick and HD monitor.
